

Non-Functional Requirements

Non-Functional Requirement 1: Security of users

Make sure all user data such as username and password is secure such that no other person can access that data. The records of employees also need to be secure, as they contain personal information. Employees should not be able to view other employee's personal information or their password.

Non-Functional Requirement 2: Supportability

The system should be able to run on various operating systems, namely Windows 7, 8 10 and Mac OS.

Non-Functional Requirement 3: Recoverability

If the system crashes, no saved data is lost. For example, if a manager is entering in information for a new employee and the system crashes, the information that the manager entered will be lost unless he/she saved it.

Non-Functional Requirement 4: Usability

A new employee should be able to use the system with minimal training (3 hours). It should not require the user to be very familiar with technology.
